

During the weekend (April 27 & 28, 2013), three stationary air monitoring sites will be operational. Two of the instruments will be west of the facility and east of the affected neighborhood. The third instrument will be located north of the affected neighborhood on the grounds of a City of West public drinking water storage tank. The instruments will continue to be utilized to monitor for ammonia and volatile organic compounds while the residents of the affected neighborhood are allowed to re-enter their homes for the first time since the explosion.
